SUMMARY

Computer Engineering graduate with hands-on experience building responsive React applications and improving user workflows. Also comfortable handling backend tasks using Python, Flask, FastAPI, and database features when needed. Comfortable working across the stack to ship features end-to-end, from UI to database logic.

EDUCATION

August 2020 –
July 2025
Pasig City

Bachelor of Science in Computer Engineering *Rizal Technological University - Pasig Campus*

- Developed strong programming and software development expertise using Java, MySQL, Python, .NET, C++, HTML, and CSS
- Designed and implemented hardware and software solutions, including thesis projects with Raspberry Pi and Arduino Uno
- Applied advanced knowledge in Object-Oriented Programming (OOP), Advanced Programming, and Embedded Systems
- Acquired skills in basic computer hardware troubleshooting and repair
- Successfully completed 6 major academic software and hardware projects individually and as a team leader

WORK EXPERIENCE

Aug 2025 – Present
Antipolo Rizal -
Remote

Software Developer *Integrated Geosys Development Inc.*

- Worked as a frontend developer for the company's LGU-focused GIS web application, mainly using React.js for layouts, map tools, and interface updates.
- Collaborated with backend, GIS, and QA teams to fix bugs, handle large datasets, and ensure features worked smoothly in production.
- Improved component structure and state management to make the application faster and easier to maintain.

Feb 2024 – Apr 2024
Quezon City

Intern Web Developer *Intelliseven Technology Solutions Inc.*

- Transformed UI/UX designs from Figma mockups into dynamic, responsive front-end interfaces utilizing React JS and Tailwind CSS.
- Integrated front-end components with an existing Express JS backend, using React hooks (useEffect) to fetch, render, and update account data.
- Managed codebase changes using Git and GitHub, pushing 30+ commits to track progress and update features.
- Engaged in team discussions and feedback sessions to ensure smooth workflow and successful project delivery.

SKILLS

Frontend Development

React JS, HTML5, CSS3, JavaScript,
Tailwind CSS

Backend Development

Python, Flask, REST API
Development, FastAPI

Database

MySQL, PostgreSQL

GIS Tools

QGIS, PyQt5, PostGIS, Global Mapper

Desktop/Other

Electron, Docker

PROJECTS

Aug 2024 – Feb 2025

Automated Aquaculture Monitoring System *Team Leader, Capstone Project | Rizal Technological University*

- Led a team of 5 in building an IoT and AI-driven monitoring system for catfish aquaculture, featuring real-time water quality tracking and automated mortality detection
- Built the web dashboard using React JS and Tailwind CSS, integrating a live video feed alongside real-time indicators for water temperature, pH, dissolved oxygen, and turbidity.

- Trained a YOLOv8 computer vision model on custom image datasets to detect alive vs. dead catfish, triggering instant user alerts upon detecting fish mortality.
- Developed the backend service with Flask and MySQL to log sensor data, generate printable incident reports, and predict potential causes of death based on water condition changes.
- Programmed and calibrated Arduino Uno microcontrollers and sensors to continuously collect telemetry data and automatically sync live readings and fish counts to the database.

Aug 2025 – Present

BLGF GIS Web Application

Software Developer | Integrated Geosys Development Inc.

- Redesigned and modernized the web application UI (toolbars, sidebars, and reusable modals) using React JS, Vanilla CSS and Tailwind CSS and taking full initiative in layout design and UI/UX prototyping directly from concept to code.
- Engineered a role-based authentication and user management system (Municipal vs. Provincial access levels), co-designing the PostgreSQL schema to replace legacy database-credential logins.
- Built an end-to-end Spatial Data Manager tool enabling users to browse PostGIS schemas, view row-level geometries, and seamlessly import/export data in Shapefile, GeoPackage (.gpkg), and ZIP formats.
- Integrated front-end interfaces with a FastAPI backend to handle heavy spatial queries, parcel datasets, and municipal map layer renders.
- Refactored component structures and state handling while continuously resolving application bugs to optimize performance and codebase maintainability.

Oct 2025 – Feb 2026

Computer Assisted Mass Appraisal Tools - AI Tools Module

Software Developer | Integrated Geosys Development Inc.

- Independently built a standalone, token-authenticated AI valuation module from start to finish, working closely with company leadership and a GIS teammate to define features and data flows.
- Developed the React JS front-end to connect with Python machine learning models (Linear Regression, XGBoost, Random Forest), enabling external LGU applications to execute land value predictions.
- Created interactive charts and map overlays (line/bar graphs) to help users visualize training results, parcel values, and residual error analysis.
- Added export capabilities for downloadable PDF evaluation reports, pickled model files (.pkl), and GIS Shapefiles updated with predicted land attributes.
- Dockerized the application for VM deployment, maintaining both front-end and back-end integration through ongoing updates and bug fixes.

Jan 2026 –
March 2026

Tax Map Layout - Electron JSX App

Software Developer | Integrated Geosys Development Inc.

- Developed a desktop-based Tax Map Layout Application using Electron JSX used for printing tax map layouts for barangays, its sections, and its land parcels.
- Maintained and improved the codebase, to keep printed tax map outputs accurate, clean, and consistent with the intended design.
- Improved the frontend and backend codebase through debugging, feature updates and print/export refinements.
- Refined layout generation and label placement for more reliable tax map printing.

March 2026 – Present

IGeosys LGU-Suite - GIS App

Software Developer | Integrated Geosys Development Inc.

- Co-developed core features of an LGU GIS desktop application using Python and QGIS API to streamline digital property assessment workflows.
- Designed interactive FAAS and DCS forms using Qt Designer, coding data-handling logic to comply strictly with BLGF Mass Appraisal Guidebook standards.
- Built key map controls from the ground up, including custom Layer Properties, Symbology rules, and structured Attribute forms for seamless GIS data editing.
- Fixed UI bugs and system issues flagged during QA testing cycles to maintain app performance and reliability during production rollout.
