SUMMARY

Software developer with over a year at a GIS company, working on web and desktop systems for Philippine local government units (LGUs) and the Bureau of Local Government Finance (BLGF). Projects include the BLGF web app's admin site and its PDF tax map generator, the front end of a machine-learning land valuation service, and a QGIS desktop application for property assessment. Main tools: React, FastAPI, Python, PostgreSQL/PostGIS, and PyQt5.

SKILLS

Frontend Development
React JS, HTML/CSS, JavaScript, Tailwind CSS

Backend Development
Python, Flask, REST API Development, FastAPI

Database
MySQL, PostgreSQL

GIS Tools
QGIS, PyQt5, PostGIS

Tools
Docker, Git/GitHub, Figma, AI-Assisted Workflows (Claude, ChatGPT)

WORK EXPERIENCE

Aug 2025 – Present
Antipolo, Rizal (Hybrid)

Software Developer
Integrated Geosys Development Inc.
Private GIS solutions company serving local government units (LGUs) and the Bureau of Local Government Finance (BLGF).

BLGF GIS Web App · Aug 2025 - Present · React, Tailwind CSS, FastAPI, PostgreSQL/PostGIS, ReportLab

- Designed the admin site of the BLGF web app, including its PostgreSQL database structure and React interface. Role-based Provincial and Municipal accounts now replace the former database-credential logins.
- Implemented User Management and User Groups, where admins add, edit, and delete users and limit each one's access to a province or municipality.
- Developed the Data Manager, a pgAdmin-like browser for the Shapefile and GeoPackage layers each province or municipality works with. It lists schemas and tables (one parcel table runs past 15,000 rows), shows row-level attributes, exports data, and previews geometries on a map. A companion Import Tool loads Shapefile, GeoPackage, and ZIP files into the user's assigned database through an upload queue. Both rely on FastAPI endpoints written for heavy spatial queries.
- Created the Tax Map Layout module (React interface, FastAPI/ReportLab backend). It exports five map types as print-ready PDFs, singly or in batch, according to the barangay, section, paper size, and signatories the user selects.
- Reworked the toolbars and sidebars, added reusable modals, and reorganized the component and state structure so new features take less effort to add.

Computer Assisted Mass Appraisal (CAMA) Tools: AI Valuation Module · Oct 2025 – Feb 2026 · React, Python, FastAPI, Docker, PostgreSQL/PostGIS

- Rebuilt an existing Python valuation workflow (Linear Regression, Random Forest, XGBoost) as a FastAPI service with token authentication, so outside LGU applications can request land value predictions.
- Developed the React front end: training charts, parcel value overlays on the map, and residual-error analysis. Results export as PDF reports, .pkl model files, or Shapefiles carrying the predicted land values.
- Packaged the service in Docker for VM deployment and handled its bug fixes and updates afterward.

iGeosys LGU Suite · Mar 2026 – Present · Python, QGIS API, PyQt5, Qt Designer

- Co-developed a QGIS desktop application for digital property assessment. Brought QGIS's existing Layer Properties, Symbology, and Label tools into the app and improved their interface design in PyQt5.

- Designed and developed the Field Appraisal and Assessment Sheet (FAAS) and Data Collection Sheet (DCS) forms in Qt Designer, following the BLGF Mass Appraisal Guidebook. Assessors use them to record a property's physical description, market value, and assessed value inside the app.

Feb 2024 – Apr 2024
Quezon City

Frontend Developer | Internship
Intelliseven Technology Solutions Inc.

LawChat Admin System · Feb 2024 – Apr 2024 · React, Tailwind CSS, Figma

- Part of a small frontend team that turned the UI/UX design team's Figma files into the LawChat admin website, checking details with the designers as the pages took shape.
- Responsible for the dashboard, the user and firm management pages, the login screen, and several modals, all written in React JS and Tailwind CSS.
- Added animations and made the layouts responsive across screen sizes.

EDUCATION

Aug 2020 – Jul 2025
Pasig City

Bachelor of Science in Computer Engineering
Rizal Technological University - Pasig Campus

Capstone: *Automated Aquaculture Monitoring System* | Aug 2024 – Feb 2025 | Group Leader

- Led the team in building an IoT monitoring system for catfish farming that tracks water quality in real time and detects dead fish.
- Built the React and Tailwind dashboard with a live video feed and readings for water temperature, pH, dissolved oxygen, and turbidity.
- Trained a YOLOv10 model on a custom image dataset to tell live catfish from dead ones and send an alert when it detects mortality.
- Built the Flask and MySQL backend that logs Arduino sensor data, generates printable incident reports, and suggests likely causes of death based on changes in water conditions.
